

Dashboards Made Easy Using SAS® Software

Kirk Paul Lafler, sasNerd

Abstract

Organizations around the world develop business intelligence and analytics dashboards, sometimes referred to as enterprise dashboards, to display the status of “point-in-time” metrics and key performance indicators. Effectively designed dashboards extract real-time data from multiple sources for the purpose of highlighting important information, numbers, tables, statistics, metrics, performance scorecards and other essential content. This paper explores essential rules for “good” dashboard design, the metrics frequently used in dashboards, and the use of best practice programming techniques in the design of quick and easy dashboards using SAS® software. Learn essential programming techniques to create real-world dashboards using Base-SAS® software including PROC SQL, macro, Output Delivery System (ODS), ODS HTML, ODS Excel, ODS Layout, ODS Statistical Graphics, PROC SGPLOT, PROC SGPIE, and other technologies.

Introduction

In a world of big data where data repositories and the demand placed on them are growing at explosive levels, organizations are faced with a number of decisions related to their information requirements:

- 1) What are the best ways to handle large amounts of information?
- 2) How should analytical data be processed?
- 3) What are the choices for constructing the most effective information delivery mechanisms?
- 4) How should analytical data and results be displayed?

To help answer these and other questions, this paper explains what a dashboard is, the dashboard’s elements, the do’s and don’ts for constructing effective dashboards, dashboard design techniques, an investigation of the various types of dashboards, the merits and strengths of using the base-SAS® software to construct dashboards, and an illustration of a few dashboard examples along with the base-SAS code used in their construction.

Example Table

The dashboard examples displayed in this paper reference the dataset (or table), SASHELP.CARS. The SASHELP.CARS dataset consists of 428 observations and 15 variables and is illustrated below.

SASHELP.CARS Table

Make	Model	Type	Origin	DriveTrain	MSRP	Invoice	EngineSize	Cylinders	Horsepower	MPG_City	MPG_Highway	Weight	Wheelbase	Length

“Brief” History of Dashboards

In the world of information technology, a dashboard serves as a user interface to organize and display information visually in the simplest way possible. Dashboards originated in the 1970’s as decision support tools and systems that served management, operations, and organizational planning. In the 1980’s, dashboards came of age as executive information systems emphasizing graphical displays and simple user interfaces to assist with management decision making. In the 1990’s, dashboards experienced a growing interest with the rise of the Internet. As information technology and the Internet entered the 2000’s, vendors including SAS Institute, and others, offered high-end easy-to-use products for the development of comprehensive “custom” dashboards. The dashboards being built today offer users the ability to monitor key metrics, information summaries, and reports in a single easy-to-use user interface. As a result, dashboards are designed to alert users to key business issues that impact an organization’s tactics and strategies by facilitating improved decision making activities.

So exactly what is a dashboard? In the paper, “Building Your First Dashboard Using the SAS® 9 Business Intelligence Platform: A Tutorial,” by Gregory S. Nelson (2009), Nelson describes a dashboard as a visualization technique that provides an immediate view or snapshot of exactly where you are in a specific process relative to your stated goals and objectives. He adds that, Visual indicators, such as temperature gauges, traffic lights and speedometers, help give a real-world sense of present progress and assists in making decisions, adapting to current conditions or drilling into more detailed information. As a user interface, dashboards display performance indicators (PIs), key performance indicators (KPIs), and other relevant information.

Types of Dashboards

The first step in dashboard design is to understand the purpose and type of dashboard you will need. With three types of dashboard designs available, users are encouraged to select the dashboard type that best meets your needs. The following table describes the three types of enterprise dashboards and their purpose.

Dashboard Type	Purpose
Strategic Dashboards	Strategic dashboards provide executives and managers with visual information to determine and support goals and objectives within an organization. This type of dashboard facilitates monitoring an organization’s health, progress, performance, and areas where improvement can be made. There is typically no need for interactive features with this type of dashboard. Strategic dashboard examples include: Sales, Human Resources, Manufacturing, and Services.
Analytical Dashboards	Analytical dashboards provide users with visual information to help gain a better understanding with historical, present and future data; understand trends; allow comparisons to be made; and determine the type of adjustments that are needed. Analytical dashboards should allow interactive features such as drill-down capabilities, as needed, to access more detailed information. Dashboard examples include: obtaining real-time data and information, determining why some things are working and others are not, identifying patterns and opportunities with your data, and aligning strategic objectives with performance initiatives.
Operational Dashboards	Operational dashboards provide users with visual information to concentrate on performance monitoring and measurements, monitor the efficiency and effectiveness of their organization. There is typically a need to update information displayed in an operational dashboard frequently to make it relevant to the users’ needs. Dashboard examples include: improved understanding of performance, better focus and alignment, and faster and better decision making.

Dashboard Elements

In Malik Shadan’s (2007) paper, Elements for an Enterprise Dashboard, he mentions that there are basic and advanced characteristics specific to an enterprise dashboard. The basic characteristics encompass the acronym, SMART, and the advanced characteristics of an enterprise dashboard encompass the acronym, IMPACT. The elements associated with each acronym appear in the following tables.

SMART Basic Elements	
Element	Description
Synergetic	Synergize information in a single screen view.
Monitor KPIs	Display critical KPIs for effective decision making.
Accurate	Dashboard must be well tested and validated, and information must be accurate.
Responsive	Respond to user alerts and visual content to draw immediate attention to critical matters.
Timely	Display information that is real-time and right-time for effective decision making.

IMPACT Advanced Elements	
Element	Description
Interactive	Allow user to drill-down and derive details, root causes and more.
More Data History	Allow users to review historical trends for any KPI.
Personalized	Display should be specific to each user's domain of responsibility, data restrictions, and privileges.
Analytical	Allow users to perform guided analysis, compare, contrast, and make analytical inferences.
Collaborative	Facilitate users' ability to exchange notes regarding observations on their dashboard.
Trackability	Allow each user to customize the metrics they would like to track.

13 Common Pitfalls to Avoid when Designing Dashboards

Successful dashboard design involves the transformation of quantitative data into meaningful and effective visual displays including graphs, maps, gauges and summary information. In his paper, "Common Pitfalls in Dashboard Design," Stephen Few (2006) proposes 13 common mistakes many make when designing dashboards. Instead of concentrating on what should be done when designing dashboards, Mr. Few's body of work espouses the most common mistakes along with detailed explanations to help educate current and future designers alike. I have listed the 13 common pitfalls from Mr. Few's seminal work, below, but readers are encouraged to read his entire paper, see the References section, for a complete perspective.

Stephen Few's 13 Common Pitfalls in Dashboard Design (cited from reference)

Pitfall	Description
Pitfall #1	Exceeding the Boundaries of a Single Screen
Pitfall #2	Supplying Inadequate Context for the Data
Pitfall #3	Displaying Excessive Detail or Precision
Pitfall #4	Expressing Measures Indirectly
Pitfall #5	Choosing Inappropriate Media of Display
Pitfall #6	Introducing Meaningless Variety
Pitfall #7	Using Poorly Designed Display Media
Pitfall #8	Encoding Quantitative Data Inaccurately
Pitfall #9	Arranging the Data Poorly
Pitfall #10	Ineffectively Highlighting What's Important
Pitfall #11	Cluttering the Screen with Useless Decoration
Pitfall #12	Misusing or Overusing Color
Pitfall #13	Designing an Unappealing Visual Display

Steps to Creating a Dashboard using Base-SAS® Software

Follow these basic steps to successfully construct a quick and easy dashboard using the SAS software.

1. Connect to desired data sources using Libname statement.
2. Specify an ODS HTML5 statement to produce dashboards that can be viewed with a web browser.
3. Specify an ODS LAYOUT statement to tell SAS how many row(s) and column(s) the dashboard should contain.
4. Specify an ODS REGION statement to control where output is to be placed on the dashboard.
5. Specify color settings, fonts, font attributes, and other "customizations".
6. Specify an ODS LAYOUT END statement to terminate the dashboard layout.
7. Specify an ODS HTML5 CLOSE statement to render the results to the dashboard file.

Several quick and easy dashboard examples are illustrated below.

Examples

Example #1 – (1x1) Dashboard Layout with Default Settings PROC FREQ, PROC SGPLOT and PROC MEANS

Key Points about Code

1. SAS software provides users with numerous procedures for creating dashboard output. The two procedures that are used to create the dashboard are: PROC FREQ and PROC SGPLOT.
2. An **ODS HTML5 PATH= FILE=** statement tells SAS the destination (or type of medium) to use in creating the dashboard including the destination path (or folder) and the name of the dashboard file.
3. An **ODS LAYOUT GRIDDED ROWS=1 COLUMNS=1** statement tells SAS to create a gridded layout consisting of one row and ONE column.
4. An **ODS REGION** statement tells SAS to produce the results using PROC FREQ and PROC SGPLOT.
5. An **ODS LAYOUT END** statement tells SAS to terminate the dashboard layout.
6. An **ODS HTML5 CLOSE** statement tells SAS to render the dashboard content to the dashboard file.

Base-SAS Code:

```
ods html5 path="/home/kirklafler/Dashboards/Results"
      body="Dashboard - Gridded HTML (1 x 1) Layout.html"
      (url=none) ;

title1 font=impact bold h=12 c=blue "Analytics Dashboard" ;

ODS LAYOUT GRIDDED ROWS=1 COLUMNS=1 ; /* Design HTML 1x1 Layout */

options center ; /* Center the Results */
ods region ; /* Start of Output Results */
title1 "SASHELP.CARS Frequency Distribution for Origin and Type" ;
proc freq data=SASHELP.CARS NLEVELS ;
  table Origin Type ;
run ;

title1 "Origin BarChart" ;
proc sgplot data=SASHELP.CARS ;
  vbar Origin / group=Origin datalabel ;
run ;

title1 "Type BarChart" ;
proc sgplot data=SASHELP.CARS ;
  vbar Type / group=Type datalabel ;
run ;

title1 "Origin by Type Cluster BarChart" ;
proc sgplot data=SASHELP.CARS ;
  vbar Origin / group=Type response=MSRP stat=mean groupdisplay=cluster datalabel ;
run ;

title1 "Descriptive Statistics for MSRP and Invoice by Origin" ;
proc means data=SASHELP.CARS n nmiss min max range mean median mode std var ;
  class Origin Type ;
run ;
title ;

ods layout end ; /* Terminate the Layout of Output Results */
ods html5 close ;
```

Example #2 – (1x2) Dashboard Layout with Default Settings

PROC FREQ and PROC REPORT

Number of Distinct Variable Levels (Data Cardinality)
Variable Names Displayed in Alphabetical Order

The FREQ Procedure

Number of Variable Levels				
Variable	Label	Levels	Missing Levels	Nonmissing Levels

Key Points about Code

1. SAS software provides users with numerous procedures for creating dashboard output. The two procedures that are used to create the dashboard are: PROC FREQ and PROC REPORT.
2. An **ODS HTML5 PATH= FILE=** statement tells SAS the destination (or type of medium) to use in creating the dashboard including the destination path (or folder) and the name of the dashboard file.
3. An **ODS LAYOUT GRIDDED ROWS=1 COLUMNS=2** statement tells SAS to create a gridded layout consisting of one row and two columns.
4. The first **ODS REGION** statement tells SAS to produce the first column of results using PROC FREQ.
5. The second **ODS REGION** statement tells SAS to produce the second column of results using PROC REPORT.
6. An **ODS LAYOUT END** statement tells SAS to terminate the dashboard layout.
7. An **ODS HTML5 CLOSE** statement tells SAS to render the dashboard content to the dashboard file.

Base-SAS Code:

```

Key Points about Code

1. SAS software provides users with numerous procedures for creating dashboard output. The four procedures that are used to create the dashboard are: PROC FREQ, PROC SGPLOT, PROC MEANS, and PROC UNIVARIATE.
2. An **ODS HTML5 PATH= FILE=** statement tells SAS the destination (or type of medium) to use in creating the dashboard including the destination path (or folder) and the name of the dashboard file.
3. An **ODS LAYOUT GRIDDED ROWS=2 COLUMNS=2** statement tells SAS to create a gridded layout consisting of one row and two columns.
4. Multiple **ODS REGION** statements to tell SAS to produce the row and column of results.
5. An **ODS LAYOUT END** statement tells SAS to terminate the dashboard layout.
6. An **ODS HTML5 CLOSE** statement tells SAS to render the dashboard content to the dashboard file.

Base-SAS Code:

```
ODS HTML5 PATH="/home/kirklafler/Results"
FILE="Dashboard #2 - (2x2) Layout.html"
(URL=NONE) ;

title1 font=impact bold h=12 c=blue "Analytics Dashboard" ;
ods layout start rows=2 columns=2 ;

Key Points about Code

- SAS software provides users with numerous procedures for creating dashboard output. The procedures that are used to create the dashboard are: PROC FREQ, PROC SGPIE, PROC SGPLOT, PROC MEANS, PROC REPORT, and PROC UNIVARIATE.
- An **ODS HTML5 PATH= FILE=** statement tells SAS the destination (or type of medium) to use in creating the dashboard including the destination path (or folder) and the name of the dashboard file.
- An **ODS LAYOUT GRIDDED ROWS=3 COLUMNS=3** statement tells SAS to create a gridded layout consisting of one row and two columns.
- Multiple **ODS REGION** statements to tell SAS to produce the row and column of results.
- When producing graphics (e.g., bar charts, pie charts, etc.) the statement **styleattrs DATACOLORS=(red blue yellow green purple orange goldenrod cyan)** tells SAS to display the bars and/or pie slices using the specified colors.
- An **ODS LAYOUT END** statement tells SAS to terminate the dashboard layout.
- An **ODS HTML5 CLOSE** statement tells SAS to render the dashboard content to the dashboard file.

Base-SAS Code:

Key Points about Code

- SAS software provides users with numerous procedures for creating dashboard output. The procedures that are used to create the dashboard are: PROC FREQ, PROC SGPIE, PROC SGPLOT, PROC MEANS, PROC REPORT, and PROC UNIVARIATE.
- An **ODS HTML5 PATH= FILE=** statement tells SAS the destination (or type of medium) to use in creating the dashboard including the destination path (or folder) and the name of the dashboard file.
- An **ODS LAYOUT GRIDDED ROWS=3 COLUMNS=3** statement tells SAS to create a gridded layout consisting of one row and two columns.
- Multiple **ODS REGION** statements to tell SAS to produce the row and column of results.
- When producing enlarged titles and fonts (e.g., titles, footnotes, charts, etc.) the **datalabeldisplay=all** and **datalabelattr=** options tell SAS to display the text associated with bars and/or pie slices using a larger size font.
- An **ODS LAYOUT END** statement tells SAS to terminate the dashboard layout.
- An **ODS HTML5 CLOSE** statement tells SAS to render the dashboard content to the dashboard file.

Base-SAS Code:

Key Points about Code

1. SAS Output Delivery System (ODS) provides users with the ability to create Excel dashboards, reports, and spreadsheet results using the ODS Excel destination. Any procedure output, such as PROC REPORT, PROC FREQ, PROC MEANS, PROC SGPLOT, and countless others, can be automatically written to an open Excel spreadsheet.
2. The SASHELP.CARS dataset is sorted using **PROC SORT** in ascending order by the ORIGIN and MSRP variables.
3. An **ODS EXCEL FILE=** statement tells SAS the path / folder where the spreadsheet is to be written along with the assignment of its physical name.
4. A few **ODS options are specified to** tell SAS to create and name multiple sheets with the **sheet_interval="bygroup"** option, assign the Origin variable's value to each sheet with the **sheet_label="origin"** option, embed titles into the spreadsheet with the **embedded_titles="yes"** option, freeze six (6) rows at the top of the spreadsheet with the **frozen_headers="6"** option so these rows remain fixed in-place during vertical scrolling, and assign automatic filtering (or subsetting) to the second and third variables (or columns) with the **autofilter="2-3"** option.
5. Produce detailed results using **PROC REPORT** and **TITLE** statements.
6. An **ODS Excel CLOSE** statement tells SAS to render the PROC REPORT results representing the dashboard contents to the Excel spreadsheet file.

Base-SAS Code:

```
PROC SORT DATA=SASHELP.CARS

Key Points about Code

1. PROC FORMAT provides users with the ability to create and assign user-defined formats for the application of data standardization, color assignment, and many other valuable coding techniques. In this example, the assignment of colors (i.e., "Green", "Blue", "Orange", and "Red") are applied to the background in the Excel spreadsheet.
2. The SASHELP.CARS dataset is sorted using **PROC SORT** in ascending order by the ORIGIN and MSRP variables.
3. An **ODS EXCEL FILE=** statement tells SAS the path / folder where the spreadsheet is to be written along with the assignment of its physical name.
4. A few **ODS options** are specified to tell SAS to create and name multiple sheets with the **sheet_interval="bygroup"** option, assign the Origin variable's value to each sheet with the **sheet_label="origin"** option, embed titles into the spreadsheet with the **embedded_titles="yes"** option, freeze six (6) rows at the top of the spreadsheet with the **frozen_headers="6"** option so these rows remain fixed in-place during vertical scrolling, and assign automatic filtering (or subsetting) to the second and third variables (or columns) with the **autofilter="2-3"** option.
5. Produce detailed results using **PROC REPORT** and **TITLE** statements.
6. Define MSRP as an "ANALYSIS" variable so it can be used in a COMPUTE block, along with the assignment of the background colors based on the MSRP value.
7. An **ODS Excel CLOSE** statement tells SAS to render the PROC REPORT results representing the dashboard contents to the Excel spreadsheet file.

Base-SAS Code:

```
PROC FORMAT ;
  Value MSRPfmt LOW - < 20000 = 'Green'
           20000 - < 30000 = 'Blue'
           30000 - < 40000 = 'Orange'
           40000 - HIGH    = 'Red' ;
RUN ;
```

```
PROC SORT DATA=SASHELP.CARS
  OUT=WORK.Cars_Sorted ;
  BY Origin MSRP ;
```

```
RUN ;
```

```
ODS Excel FILE="/Dashboards/Results/Dashboard #7 - Excel Autofilter Report with Traffic  
Lighting.xlsx"
```

```
    OPTIONS(sheet_interval="bygroup"  
            sheet_label="origin"  
            embedded_titles="yes"  
            frozen_headers="6"  
            autofilter="2-3") ;
```

```
TITLE1 BOLD HEIGHT=12 "Excel Multi Autofilter Report" ;
```

```

Key Points about Code

1. **PROC SORT** to order the SASHELP.CARS dataset in ascending order by the ORIGIN, MAKE, TYPE, MODEL, and MSRP variables.
2. An **ODS EXCEL FILE=** statement tells SAS the path / folder where the spreadsheet is to be written along with the assignment of its physical name, and a style definition, **STYLES.MINIMAL**, with the **STYLE=** parameter.
3. Produce detailed results using **PROC REPORT** and **TITLE** statements.
4. Define MSRP so it can be used in a **COMPUTE block**, along with the assignment of the background colors based on the MSRP value used in the COMPUTE block logic. In this example, the assignment of colors (i.e., “Green”, “Blue”, “Orange”, and “Red”) are applied to the background in the Excel spreadsheet.
5. An **ODS Excel CLOSE** statement tells SAS to render the PROC REPORT results representing the dashboard contents to the Excel spreadsheet file.

Base-SAS Code:

```
PROC SORT DATA=SASHELP.CARS
    OUT=WORK.CARS_SORTED ;
    BY Origin Make Type Model MSRP ;
RUN ;

ODS Excel FILE = 'c:\Custom Row Traffic Lighting.xlsx'
    STYLE = styles.minimal ;

Key Points about Code

1. PROC TEMPLATE provides users with the ability to create and/or customize the appearance of tabular SAS output. A new styles.SasWeb_White_Black template using PROC TEMPLATE is created by modifying two parameters ('fgB1' and 'bgA') in the style color_list section.
2. An **ODS HTML5 FILE=** statement tells SAS the path / folder where the output is to be written along with the assignment of its physical name.
3. A **TITLE** statement is specified to display the name of the dashboard.
4. An **ODS LAYOUT** statement is specified to tell SAS to define a 1 row x 1 column layout.
5. An **ODS REGION** statement is specified to indicate the beginning of output results.
6. A PROC FREQ, three PROC SGPLOTS, and a PROC MEANS is specified.

7. An **ODS LAYOUT CLOSE** statement is specified to terminate the layout of output results.
8. An **ODS HTML5 CLOSE** statement tells SAS to render the output results representing the dashboard contents to the HTML5 file.

Base-SAS Code:

```
proc template ;
  define style Styles.Sasweb_White_Black ;
    style color_list
      "Colors used in the default style" /
      'fgD1' = cx666666 /* Gray */

Key Points about Code

1. A new style template, `Styles.Sasweb_Black_Burgundy`, is created with `PROC TEMPLATE` that inherits the attributes of its parent template, `Styles.SASWEB`. The new template replaces two parameters ('`fgB1`' and '`bgA1`') in the style `color_list` section.
2. An **ODS HTML5 FILE=** statement tells SAS the path / folder where the output is to be written along with the

5. An **ODS REGION** statement is specified to indicate the beginning of output results.
6. A PROC FREQ, three PROC SGPLOTS, and a PROC MEANS is specified.
7. An **ODS LAYOUT CLOSE** statement is specified to terminate the layout of output results.
8. An **ODS HTML5 CLOSE** statement tells SAS to render the output results representing the dashboard contents to the HTML5 file.

Base-SAS Code:

```
proc template ;
  define style Styles.Sasweb_Black_Burgundy ;
    parent = Styles.SASWEB ;
    replace color_list /
      'fgD1' = cx666666 /* Gray */
      'fgC1' = cxCCCCC /* Light Gray */
      'fgB1' = CX000000 /* Black */
      'bgA1' = CX800020 /* Burgundy */
      'fgA' = CX000000 /* Black */
      'bgA' = CXFFFFFF /* White */
  end ;
run ;

Conclusion

Organizations around the globe develop business intelligence and analytics dashboards to display the status of “point-in-time” metrics and key performance indicators. An effectively designed dashboard extracts real-time data from multiple sources for the purpose of highlighting important information, numbers, tables, statistics, metrics, performance scorecards and other essential content. This paper explored essential rules for “good” dashboard design, the metrics frequently used in dashboards, and the use of best practice programming techniques in the design of aesthetically pleasing dashboards using SAS® software. Readers were shown programming techniques to create quick and easy dashboards using Base-SAS® software including PROC SQL, macro, Output Delivery System (ODS), ODS HTML, ODS Excel, ODS Layout, ODS Statistical Graphics, PROC SGPLOT, and PROC SGPIE.

Acknowledgments

The author thanks the IowaSUG 2025 Conference Committee, particularly the Conference Chairs, John Xu, Simon Geletta, and Jeremy Mitchell, for accepting my paper and organizing a great “in-person” one-day conference; SAS Institute Inc. for providing SAS users with wonderful software; and SAS users everywhere for being the nicest people anywhere!

Author Information

Kirk Paul Lafler is a consultant, developer, programmer, educator, and data scientist; and teaches SAS Programming and Data Management in the Statistics Department at San Diego State University. Kirk also provides project-based consulting and programming services to client organizations in a variety of industries including healthcare, life sciences, and business; and teaches “virtual” and “live” SAS, SQL, Python, Database Management Systems (DBMS) technologies (e.g., Oracle, SQL-Server, Teradata, MySQL, MongoDB, PostgreSQL, AWS), Excel, R, cloud-based technologies, and other software and tools. Currently, Kirk serves as the Western Users of SAS Software (WUSS) Executive Committee (EC) Open-Source Advocate and Coordinator and is actively involved with several proprietary and open-source software user groups and conference committees. As the author of several books including the popular [PROC SQL: Beyond the Basics Using SAS, Third Edition \(SAS Press, 2019\)](#), Kirk is an Invited speaker, educator, keynote, and mentor, and is the recipient of 29 “Best” contributed paper, hands-on workshop (HOW), and poster awards.
